

# Cups client configuration, Slackware

Since cups ~1.6 the browsing method for locating shared printers changed. While the move is towards avahi for printer discovery, cups can still function without it. Assuming the server-side is up and running, the only client-side steps needed seem to be:

1. `vim /etc/cups/cups-browsed.conf`

```
BrowsePoll <server_ip>:631
```

2. `chmod +x /etc/rc.d/rc.cups-browsed && /etc/rc.d/rc.cups-browsed start`

As `rc.cups-browsed` doesn't seem to be called from `rc.M`, you may also want to start it in `rc.local` and stop it in `rc.local_shutdown`.
